

Architecture Overview

Public evaluation architecture for Google AI Agents Challenge 2026

Agents propose. Humans approve. Receipts prove what changed.

Live Event Surface

Replit demo surface: judge-facing UI, Maestro Floor, QR credential, receipt/keychain views.

Agent Runtime

Cloud Run CueR Agent API plus CueR reference service for health, floor state, proposals, and agent card endpoints.

Proof Layer

Receipt/keychain schemas for signed operational memory; approved actions become portable, verifiable records.

Canonical public chain

Replit demo surface -> Cloud Run CueR Agent API -> CueR reference agent service -> MCP adapter boundary -> A2A-ready agent card -> Receipt/keychain schemas.

IP boundary: this repository is not the StagePort production platform. It is a public evaluation surface for one synthetic hackathon use-case instance.
